PROJECTS

Computational Modeling & Numerical Methods for Engineering Systems

Course Project | *React, Python, FastAPI, Tailwind CSS*

- Developed a full-stack web tool to visualise numerical algorithms -- Newton-Raphson, Gauss-Seidel, LU decomposition -- applied to engineering problems such as heat-transfer and non-linear systems; implemented convergence tracking and stepby-step error analysis for each method.

- Engineered a structured computation pipeline enabling side-by-side method comparison and validation; adopted for courselevel demonstration of iterative solving techniques in the Chemical Engineering curriculum.

Virtual Memory & TLB Simulator

Personal Project | C++17, pthreads

- Developed a modular simulator of 32-bit virtual memory: 2-level hierarchical page table with lazy allocation, fullyassociative O(1) LRU TLB (list + hashmap), and FIFO/LRU/Clock page replacement -- all O(1) -- with a dirty-bit write-back backing store.
- Supported concurrent multi-process execution guarded by pthread_rwlock_t, atomic statis
